User Journey Document 04

Login, Signup, and Travel Identity/Profile Setup

---

1. Purpose of this document

This document defines the fourth key user journey in the travel planning app: enabling a customer to **create an account, sign in, and set up their travel identity/profile** so they can save itineraries, share trips, and store travel-related details for future use.

It describes how a customer:

- reaches an authentication gate,
- signs up or signs in,
- provides basic account information,
- adds travel identity details such as passport and visa information,
- understands why this data is useful,
- completes onboarding,
- and returns to the trip flow without losing progress.

This document is intended to work both as:

1. a **customer journey / product requirement document**, and
2. a **handoff input for Figma Make, Replit, Claude, or Codex** to design and implement the journey like a professional consumer app.

---

2. Journey name

Journey 4: Login, Signup, and Travel Identity/Profile Setup

---

3. Journey summary

The customer should be able to browse and explore the app before logging in, but when they want to perform high-value actions such as **saving an itinerary**, **sharing a trip**, or **storing travel details**, the app should require authentication.

The login and signup experience should feel simple, trustworthy, and clearly connected to the value the customer gets in return. After account creation, the customer should be guided through a lightweight onboarding flow where they can enter personal and travel-related information such as:

- full name
- email / phone
- address or country of residence
- nationality
- passport details
- visa details
- optional travel preferences

The key product requirement is that this flow should not feel like an administrative form. It should feel like enabling a smarter, more personalized travel planning experience.

After the flow is complete, the customer should be returned directly to the action they originally wanted to take, such as saving or sharing an itinerary.

---

4. Why this journey matters

This journey matters because it converts an anonymous browser into a persistent user with a reusable travel identity.

It enables:

- trip saving
- trip sharing
- multi-session continuity
- personalized itinerary planning
- future travel-related features such as document storage and eligibility checks

If done well, the customer should feel:

- “This is quick and worth doing”
- “My information is handled carefully”
- “I understand why the app needs this”
- “I can now save and manage my trips properly”

---

5. User goal

The user wants to answer a simple question:

“How do I create my account and set up my travel details so I can save and use the app properly?”

---

6. Product goal

The system should:

- make signup and login simple,
- explain why account creation is necessary,
- gather travel identity information in a structured and trustworthy way,
- avoid losing the user’s current trip context,
- and return the user seamlessly to the original task after completion.

---

7. Start state and end state

Start state

The user is exploring the app, or attempting to save/share/use account-dependent functionality, but is not authenticated or has not completed profile setup.

End state

The user has:

- created an account or signed in,
- completed the required parts of profile/travel identity setup,
- understood what information is stored,
- and returned to the original action with their progress preserved.

---

8. User persona for this journey

This journey is designed for users who:

- want to save trips for later
- want to share trips with others
- want a reusable planning identity across multiple trips
- may travel internationally and want to keep travel documents/details accessible
- expect a consumer-grade signup experience, not a bureaucratic one

This can support:

- solo travelers
- couples
- families
- frequent travelers
- international travelers
- trip planners coordinating across multiple destinations

---

9. High-level journey flow

User Attempts Save / Share / Account-Dependent Action
→ **Auth Gate**
→ **Sign Up or Sign In**
→ **Basic Account Setup**
→ **Travel Identity / Profile Setup**
→ **Passport / Visa Details**
→ **Consent and Confirmation**
→ **Return to Original Flow**

---

10. Detailed user journey flow

Step 1: Customer reaches an auth-required moment

User intent

The customer wants to do something valuable, such as:

- save an itinerary
- share a trip
- store trip details
- access saved trips later

User sees

The app presents a clear gate explaining that this action requires an account.

Messaging goal

The app should frame login/signup as an enabler, not as a barrier.

Example positioning

- Save your itinerary and access it anytime
- Share your trip with friends
- Store travel details for faster future planning

User actions

- continue with signup
- sign in instead
- dismiss and go back

System response

The system preserves the user’s current progress and prepares to resume the flow afterward.

Exit condition

The user chooses signup or sign-in.

Step 2: Customer chooses sign up or sign in

User intent

The customer wants to authenticate quickly.

User sees

A clean auth screen with options such as:

- continue with email
- continue with phone
- continue with Google
- continue with Apple
- sign in if already a user

Design goal

This step should feel lightweight and familiar.

User actions

- choose account creation method
- choose sign-in method
- switch between signup and login

System response

The system follows the selected identity path.

Exit condition

The user successfully starts account creation or sign-in.

Step 3: Customer completes account creation or login

User intent

The customer wants to establish access to the app.

Signup path

The customer provides:

- full name
- email address or phone number
- password or OTP-based verification

Sign-in path

The customer provides:

- existing email/phone
- password or OTP
- social login confirmation

System behavior

The system should:

- verify identity
- create the user account if new
- restore account state if existing

UX rule

This step should be fast and standard. Do not overload it with too many fields.

Exit condition

The customer is authenticated.

Step 4: Customer enters profile setup

User intent

The customer wants to complete the minimum information needed to use the app fully.

User sees

A guided onboarding flow with progress indication.

This onboarding should be clearly structured into small steps rather than one long form.

Suggested sequencing

1. basic profile
2. travel identity
3. passport details
4. visa details

5. confirmation

User actions

- fill details
- skip optional sections where allowed
- continue
- go back

System response

The system saves progress as the user moves forward.

Exit condition

The user completes the basic profile step.

Step 5: Customer fills basic profile

User intent

The customer wants to establish their profile identity.

Information captured

This may include:

- full legal name
- display name if different
- country of residence
- address or city
- nationality
- date of birth, if needed
- contact number

Why this matters

This information supports personalization, saved trips, and later travel-related features.

UX goal

Keep it clean, short, and confidence-building.

Exit condition

Basic profile is complete.

Step 6: Customer adds passport details

User intent

The customer wants the app to understand their travel identity more deeply.

Information captured

This may include:

- passport issuing country
- passport number
- issue date
- expiry date
- passport holder name
- optional passport scan upload

Design note

This is a sensitive step and should be handled carefully in the UI.

The screen must clearly communicate:

- why this information is useful
- how it will be used
- that the information is stored securely

User actions

- manually enter passport details
- optionally upload or scan passport
- skip if allowed
- continue

System response

The system validates fields and stores them securely.

Exit condition

Passport step is completed or intentionally skipped if product allows it.

Step 7: Customer adds visa details

User intent

The customer wants the app to support future travel planning more intelligently.

Information captured

This may include:

- country of residence
- visa status or type
- countries/regions with valid visas
- visa expiry dates
- permit or travel eligibility details
- optional supporting document upload

Why this matters

This can support future trip planning logic, document management, and travel preparation.

UX goal

This screen should feel optional or selectively required depending on product policy. It should not feel invasive.

Exit condition

Visa details are completed or skipped where allowed.

Step 8: Customer reviews consent and confirmation

User intent

The customer wants to understand and approve what they are saving.

User sees

A simple review screen summarizing:

- account information
- travel identity details
- passport details entered
- visa information entered
- privacy/consent notice

User actions

- confirm and save
- go back and edit
- review privacy information

System response

The system stores the profile and marks setup as complete.

Exit condition

The profile setup is confirmed.

Step 9: Customer returns to their original flow

User intent

The customer wants to continue where they left off.

User sees

The app returns them directly to the action that triggered the auth journey.

Examples:

- if they tried to save an itinerary, the save completes or resumes
- if they tried to share, the share flow resumes
- if they were editing a trip, they return to the trip

UX goal

This handoff must feel seamless. The user should not have to manually navigate back and repeat actions.

End condition

The customer resumes the original task as an authenticated, fully enabled user.

---

11. Functional requirements

11.1 Auth gate requirements

The app must:

- trigger login/signup when a save/share/account-dependent action occurs
- explain why authentication is required
- preserve current context and progress

11.2 Signup and login requirements

The app must:

- support signup and sign-in flows
- support email, phone, or social login methods as defined by product scope
- verify identity securely
- allow switching between new and existing account flows

11.3 Profile setup requirements

The app must:

- guide the user through profile setup in steps
- collect required basic account information
- store progress through the onboarding sequence
- allow back navigation

11.4 Travel identity requirements

The app must:

- support storing nationality and residence information
- support passport information entry
- support visa information entry
- optionally support document upload or scan

11.5 Privacy and consent requirements

The app must:

- clearly communicate why sensitive travel details are being collected
- provide a consent or acknowledgment step
- reassure users about secure storage and usage

11.6 Resume-flow requirements

The app must:

- return the user to the exact action that triggered the auth flow
- preserve unsaved trip context, selections, and progress
- avoid forcing the user to restart the original task

---

12. UX principles for this journey

This journey should feel:

Trustworthy

Sensitive data entry must feel safe, intentional, and well-explained.

Simple

Authentication should be quick and familiar.

Progressive

Collect information in steps, not as one overwhelming form.

Contextual

Explain why the user is seeing this flow right now.

Reassuring

Use clear privacy language and secure-data cues.

Seamless

Once complete, the user should land right back in the flow they were already in.

---

13. Screen-by-screen UI specification

Screen 1: Auth Gate

Purpose

To explain why account creation or sign-in is needed.

Primary UI blocks

- title such as Save your trip or Create an account to continue
- short explanation of benefits
- primary CTA to continue
- secondary CTA to sign in
- optional dismiss/back action

Recommended value copy

- Save itineraries and access them anytime
- Share trips with friends and family
- Keep your travel details ready for future plans

Required actions

- continue to signup

- sign in
- go back

Screen 2: Signup / Login Choice Screen

Purpose

To let the user pick the fastest authentication path.

UI blocks

- email signup button
- phone signup button
- Google login
- Apple login
- existing account sign-in link

Required actions

- choose login method
- switch between sign up and sign in

UX rule

This screen should be visually minimal and familiar.

Screen 3: Account Creation / Verification Screen

Purpose

To complete the actual creation or login step.

Signup fields

- name
- email or phone
- password or OTP verification

Sign-in fields

- email or phone
- password or OTP

Required actions

- submit
- resend code if OTP
- forgot password if password-based
- return

System feedback

- inline errors
- loading state
- success state

Screen 4: Basic Profile Setup Screen

Purpose

To collect foundational user profile information.

UI fields

- full name
- country of residence
- nationality
- address or city
- phone number if not yet added
- date of birth if needed

UI treatment

Use a progress indicator such as Step 1 of 4.

Required actions

- continue
- save and continue
- back

Screen 5: Passport Details Screen

Purpose

To capture passport information cleanly and securely.

UI fields

- passport issuing country
- passport number
- issue date
- expiry date
- passport holder name
- upload/scan option

Supporting UI elements

- short explanation of why this helps
- secure storage reassurance
- help text for scan/upload

Required actions

- save and continue
- skip if allowed
- back

Screen 6: Visa Details Screen

Purpose

To capture travel eligibility information.

UI fields

- residence country
- visa type
- countries/regions covered
- expiry date
- upload supporting file optionally

Supporting UI elements

- optional tag or badge if this step is optional
- help note on how the app may use this later

Required actions

- save and continue
- skip if allowed
- back

Screen 7: Review and Consent Screen

Purpose

To confirm profile setup before completion.

UI blocks

- summary cards for account, passport, and visa details
- edit links for each section
- consent checkbox
- privacy note
- confirm button

Required actions

- confirm and finish
- edit any section
- view privacy information

Screen 8: Success / Return-to-Flow Screen

Purpose

To confirm successful onboarding and return the user to the original action.

UI blocks

- success message
- short note that account is ready
- continue CTA

Behavior

The continue CTA should bring the user back into:

- save itinerary
- share itinerary
- trips area
- or whichever flow they came from

---

14. Information architecture for account and travel identity

The account/profile area should preserve the following structure:

Account

- login credentials
- name
- contact info

Travel Profile

- nationality
- residence
- passport details
- visa details
- optional travel preferences

Optional future additions

- frequent flyer numbers
- loyalty programs
- emergency contact
- preferred travel pace

- preferred cuisines
- budget style

---

15. Edge cases and states

User starts signup but does not finish

The app should preserve progress if possible and allow resume later.

User has an account but forgot password

Support password reset or OTP recovery.

User signs in with a different method

The app should avoid duplicate-account confusion where possible.

Sensitive field validation fails

Show clear inline validation for:

- invalid passport number format
- expired passport
- missing visa expiry
- incomplete mandatory fields

User skips passport or visa steps

If product allows skipping, clearly mark profile as partially complete and prompt later when needed.

User is interrupted mid-onboarding

The app should preserve the triggering trip context and return gracefully later.

User is concerned about privacy

Provide clear privacy explanations, secure storage messaging, and accessible help text.

---

16. What the customer should feel during this journey

The customer should feel:

- “This is easy to complete”
- “I understand why the app needs this”
- “My information is being handled responsibly”
- “I won’t lose my trip progress”
- “This setup will help me in future travel planning”

---

17. Acceptance criteria

This journey is successful if the user can:

1. encounter a clear auth gate when needed
2. sign up or sign in without confusion
3. complete basic account setup
4. provide travel identity details such as nationality, passport, and visa information
5. understand why this data is being collected
6. confirm and save the profile
7. return directly to the original task without losing context

---

18. Handoff prompt for Figma Make / Replit / AI design tools

Use this prompt to generate the detailed design flow:

> Design a premium mobile-first travel app flow for login, signup, and travel identity/profile setup. The flow should begin when a user tries to save or share an

itinerary and is shown a clean auth gate explaining the benefits of creating an account. The user should be able to sign up or sign in using email, phone, Google, or Apple. After authentication, guide the user through a progressive profile setup flow with step indicators. Collect basic profile details such as full name, nationality, country of residence, and contact information, followed by passport details and visa details. Sensitive data screens should feel secure, trustworthy, and clearly explain why the information is useful. The flow should end with a review and consent screen, then a success state that returns the user directly to the original action such as saving or sharing a trip. The design should feel modern, consumer-friendly, secure, polished, and lightweight rather than bureaucratic.
